For store managers and ordinary workers. Updated 24 October 2026.

This guide describes the current app. Your account determines which pages and buttons you can use. Some actions also depend on the features your administrator has enabled.

1. Getting started

Sign in

1. Open your store's app address in a browser.
2. Enter the email address and password provided for your account.
3. Select **Login**.
4. Check the store name shown at the top of the screen before recording anything.

Business owners can create a new business and store using **Sign up as organization owner** on the login page, when signup is enabled. A manager creates ordinary worker accounts through **Manage Accounts**; workers should not use business signup to join an existing store. New workers can sign in without confirming an email.

Sign up as organization owner

1. Select **Sign up as organization owner** on the login page.
2. Enter your name, **Business / organization name**, store name and email address. Phone number is optional.
3. Choose a password of at least 12 characters and enter it again in **Confirm password**.
4. Select **Create business** once and wait for the result.
5. If email confirmation is enabled, check your inbox, confirm the email and sign in. Otherwise, your owner dashboard opens immediately.

Your new store starts as general retail, with ZMW currency and Zambia's Africa/Lusaka timezone. Add products, receive stock and create worker accounts to get started. Signup creates a new business and store; it does not give access to another person's store. If the signup button is absent, ask the administrator to finish enabling signup. Use **Back to login** to return without creating an account.

If signup reports an uncertain failure, try signing in or ask the administrator to check your account before submitting another signup.

Forgot your password?

1. On the login page, select **Forgot password?**
2. Enter your account email address and select **Send reset link**.
3. Check your inbox and spam folder. The confirmation message is the same whether or not an account exists for that address.
4. Open the newest reset email and follow its link. You should see **Choose a new password**.
5. Enter a new password of at least 12 characters, enter it again, and select **Update password**.
6. When the app returns to login, sign in with your new password.

Use **Back to login** to leave the email-request form. Use **Cancel and return to login** to leave a valid reset form and close its reset session. If a link is invalid, expired or already consumed, request a new one. If you see a rate-limit message, wait before requesting another email.

If the email does not arrive, contact the administrator to check email delivery. Password-reset email is still needed even when signup email confirmation is disabled. You cannot reset another person's password or change their login email from the team page.

Your role

Page or action	Ordinary worker	Manager
Dashboard	Your own sales and store availability	Store sales and stock alerts
Products	View active products and prices	Add, edit and activate/deactivate products
Sales	Record sales and view your own sales	Record sales, view store sales and cancel eligible sales
Inventory	View main and sellable stock	Also view return holding, adjust stock and set reorder levels
Suppliers and Purchases	Not available	Manage suppliers and receive/cancel purchases
Expenses	Not available	Record expenses; cancel only if enabled
Manage Accounts	Not available	Create and edit ordinary workers
Batches & Expiry	No management page	Manage tracking, batches, expiry holds and adjustments
Returns & Refunds	Not available	Record returns, process holding, record refunds and void eligible mistakes
Reports and Operating Summary	Not available	View store reports and export report data
Audit History and Settings	Not available	View history/store settings and set the timezone

A manager's access is limited to their own store. Being in the same organization does not give access to other stores. There is no store-switching button in this version.

Organization owners

Owners have all manager actions for their assigned store, plus an **Organization** page. Your account label shows **Organization Owner**. The organization is the business; each store is a branch within that business.

On **Organization** you can:

- View the business name, legal name, currency and tax number, when recorded.
- See every store in your organization, including inactive stores, with its address, type, timezone, status and staff counts.
- View all managers and workers, their assigned stores, phone numbers and account status.

- Search by store, staff name or phone number. Clear the search to see all rows again.
- Select **View store** to see that branch's details and its team, including staff start dates.

To add a branch, select **Add store**. Enter its store name, an optional address, store type and timezone. For Zambia use **Africa/Lusaka**. Select **Create store**. The new store appears in your Stores list with an empty team. Store names must be different within your business, even if an existing store is inactive.

New stores belong automatically to your organization. Creating a store requires internet. Your current store assignment stays the same, and an administrator must separately assign a manager to the new store. If a save is uncertain, retry the same open form instead of opening another form; it keeps the same request reference.

The other operational pages continue to manage the assigned store shown in the header. Managers who are not owners remain restricted to their own store; ordinary workers do not get the Organization page. New organization-owner signups create a separate business and first store. Existing owners are assigned administratively.

Moving around

- Use the left menu to open a page. On a phone, select **Menu** first.
- Select the current page again in the menu to reload its saved information. Successful changes update the page automatically.
- Use a page's search box to find records. Clear the search to show the full list again.
- On small screens, swipe wide tables sideways to see columns and action buttons on the right.
- Read the success or error message after saving. A button becoming available again does not, by itself, prove that a record was saved.
- Select **Cancel**, **Close**, or the **×** in a form to leave it before saving. That does not undo something already saved.
- Select **Logout** when finished, especially on a shared device. You may need to scroll down inside the menu to reach it.

Dropdown menus are searchable: open a menu, type part of a name in **Type to search…**, then select a matching option. Clear the search to see all options. Searching alone does not change your selection. On a keyboard, use the arrow keys and Enter to select; Escape closes the menu.

Refreshing, navigating away, or closing a form can lose unsaved entries. Avoid doing this while a save is in progress.

2. Dashboard

The Dashboard gives a quick view of activity. A worker sees their own completed sales; a manager sees completed sales for the store.

What you can see

- **Today's gross sales:** value of completed sales today, before customer returns are deducted.
- **Today's transactions:** number of completed sales today.
- **Active products:** products currently available in the catalog.
- **Low-stock products:** manager alert count based on stock that can actually be sold.
- **Products available:** the worker's count of products with sellable stock.

- A sales chart for the last seven days. Dates use labels such as **12 Oct** and **Today**, based on your store timezone.
- Restock alerts for managers, or available inventory for workers.
- A short list of recent sales.

Actions

- On the web app, select **Record sale** to go straight to the sale form in Sales. On mobile, it opens the product picker and cart while you stay on the dashboard.
- Select **Dashboard** in the menu again to reload the figures.
- Open **Sales** for the full sales history. Open **Inventory** or **Reports** for more stock detail.

The dashboard lists are summaries, not the complete history. Gross sales are not profit and are not the same as money left after expenses or refunds.

3. Products

Use Products to look up names, SKUs, categories, units, prices, sellable quantities and status. A **SKU** is the store's short code for a product, such as SOAP-001. Buying prices are visible to ordinary workers in this app.

Find a product — workers and managers

1. Open **Products**.
2. Use the search box to search by a name, SKU or category.
3. Check the selling unit and price before recording a sale.

Add a product — managers

1. Select **Add product**.
2. Enter the **Product name**. **SKU** is optional: enter your own unique product code, or leave it blank and the app generates one.
3. Add a category if useful, such as Groceries or Clothing.
4. Enter the **Selling price** and **Buying price** for one item or pack.
5. Choose a supplier if applicable.
6. Select **Save** and check the success message.

Adding a product does not add stock. Receive stock through Purchases, or use an authorized stock adjustment for an appropriate opening balance/correction.

Stock is counted in whole items. For different sizes, colours or packs, create separate products with clear names, such as Cola 500 ml and Cola 2 L. There is no group or attribute setup. New products use the internal selling unit **each**. A pack sold as one product counts as one item; the app does not automatically split packs into individual pieces. Existing product units and historical information are retained.

Edit or change availability — managers

- Select **Edit** to change the allowed product details, prices or supplier, then **Save**. Clearing the SKU field keeps the existing code.
- Select **Deactivate** and confirm with **Save** to stop offering a product for new sales.

- Select **Activate** and **Save** to make an eligible inactive product active again.

Deactivation does not remove stock or erase past transactions. Do not deactivate a product as a substitute for recording damaged or missing stock.

4. Sales

Use Sales to record customer purchases and review sale history. Workers see their own sales; managers see their store's sales.

Record a sale

1. Select **Record sale**.
2. Choose the payment method: **Cash**, **Card**, **Bank transfer**, **Mobile Money**, or **Other**.
3. Choose a product and enter the quantity being sold.
4. Select **Add item** for more products. Select **Remove item** to remove an unwanted line.
5. Use one line per product. If a product appears twice, combine the quantities into one line.
6. Check products, units, quantities and payment method. Confirm payment using your store's normal process.
7. Select **Record sale** and wait for confirmation.
8. Find the saved sale in the history and use **Details** to check its total and items.

The app uses the current selling prices automatically. You cannot type a different price, discount or tax adjustment in this sale form. The saved total is the final amount recorded by the system.

Selecting a payment method records how payment was made. It does not charge a card, collect Mobile Money or transfer money. The web form has no cash-tender/change calculation. The mobile form has an optional cash calculator, described below.

Enter whole quantities such as 1, 2 or 3. Fractional quantities such as 0.5 are not accepted. Prices and payment amounts still allow cents.

If any item is invalid or has insufficient sellable stock, the sale is rejected as a whole. Another user may sell the last unit while your form is open; refresh availability if the app reports insufficient stock.

Find a sale and inspect details

Use the search box to find products, staff names, payment methods or status. Select **Details** to see the status, total, quantities, original unit prices and line totals. Technical references are available under **Support references**. For a tracked product, the details also show the original batches used.

Cancel an entire sale — managers

1. Find the incorrect sale and select **Cancel sale**.
2. Enter the reason.
3. Select **Save** and confirm that the sale becomes cancelled.

Cancellation reverses the whole sale and restores its original stock allocation when allowed. It does not delete the history or send money to the customer. Handle any real payment reversal separately.

Use cancellation for an eligible erroneous whole sale. If a customer is returning goods from a genuine completed sale, use **Returns & Refunds** instead. A sale with an active customer return cannot be cancelled. If all its returns were legitimately voided, cancellation may become available again, subject to the app's checks.

5. Inventory

Inventory helps explain where stock is and what can be sold. Search for a product to check its position.

Term	Meaning
Main stock	Goods recorded in the main inventory; some may be blocked from sale
Return quarantine	Returned goods held separately while awaiting a decision
Total physical	Main stock plus return quarantine for that product
Sellable	Quantity currently eligible for sale

For example, main stock can be 10 and return quarantine 2, making total physical 12. If three main-stock units are expired or blocked, only seven may be sellable. Workers see main and sellable stock; managers also see return quarantine and total physical.

Set a reorder level — managers

1. Find the product and select **Reorder level**.
2. Enter the quantity at which the store should receive a low-stock alert.
3. Select **Save**.

A low-stock alert is based on sellable stock at or below that level. A reorder level of zero is allowed. Setting a level does not receive or order any goods.

Adjust stock — managers, untracked products

1. Count/check the actual stock and determine the difference to correct.
2. Select **Adjust stock**.
3. Enter a positive number to add units, or a negative number to remove units.
4. Enter a clear reason, such as Damaged stock or Count correction.
5. Select **Save** and check the new balance.

Example: the app shows 10, but a verified count is eight. Enter **-2**, not 8. An adjustment cannot make stock negative.

For a tracked product, use **Manage batches** to open Batches & Expiry and adjust the actual batch. Use Purchases for received supplier stock rather than replacing purchase history with a manual adjustment.

6. Suppliers — managers

Use Suppliers to maintain supplier details and contact numbers. The **Phone numbers** column shows all saved numbers, or **Not added** if none are saved. Search by supplier details or phone number before adding another supplier.

Add or edit a supplier

1. Select **Add supplier**, or **Edit** beside an existing supplier.
2. Enter/update the name, optional email and optional address.
3. Select **Save**.

Manage phone numbers

1. Select **Phone numbers** beside the supplier.
2. To add a number, enter it in **Add phone number** and select **Add number**.
3. To change a number, select **Edit number**, enter the corrected number and **Save**.
4. To remove a number, select **Remove number** and confirm with **Remove number**.

You can save more than one number per supplier. Numbers keep their leading zero or international prefix, such as 0971234567 or +260 97 123 4567. After saving a number, the supplier table updates automatically. Removing a contact number does not remove the supplier or their purchase history.

Activate or deactivate

Select **Deactivate** or **Activate**, then **Save**. An inactive supplier is not offered for a new purchase. Past purchases remain visible. The app does not provide a supplier-history deletion action.

7. Purchases — managers

Use Purchases to record goods actually received from suppliers. Recording a purchase increases stock and saves the received quantities and costs.

Receive a purchase

1. Ensure the supplier and products have already been added and are active.
2. Select **Receive purchase** and choose the supplier.
3. Select the product, received quantity and unit cost.
4. Select **Add item** for other products, or **Remove item** to remove a line.
5. For each tracked product, complete its batch entries before saving.
6. Select **Receive stock** and wait for confirmation.
7. Use **Details** to check the saved purchase and totals.

Use one line per product. The unit cost is the cost of one selling unit. The system calculates and rounds the line totals. It saves the purchase and its stock changes together; an invalid item prevents the complete purchase from being saved.

Receive batches

When a tracked product is selected, batch fields appear. For each batch, enter its number, quantity and expiry date where required. Use **Add batch** or **Remove batch** as needed.

All batch quantities for one product must add up exactly to that product's received quantity. For example, receiving five units could be split into two in Batch A and three in Batch B. Do not enter five in both batches. Required expiry dates cannot be omitted; the app rejects ineligible expired receipts.

View or cancel a purchase

- Use search to find a supplier, product or status.
- Select **Details** to see received items, quantities, unit costs and totals.
- For an incorrect eligible purchase, select **Cancel purchase**, enter a reason and **Save**.

Cancellation removes the originally received quantities when the required stock is still available. It may be rejected after goods were sold, disposed of or otherwise made unavailable. It does not erase the purchase, pay the supplier, reverse a bank transaction or record a supplier return/credit note.

8. Expenses — managers

Use Expenses to record store spending such as rent, transport or utilities.

Record an expense

1. Select **Record expense**.
2. Enter a category and a useful description.
3. Enter an amount greater than zero, with no more than two decimal places.
4. Choose **Cash**, **Card**, **Bank transfer**, **Mobile Money**, or **Other**.
5. Select **Save** and check the new record.

The entry receives its recorded date/time when saved. Recording an expense does not make the payment. Use search to find expenses by their recorded details and payment method.

Cancel an incorrect expense, if available

If **Cancel** appears beside a recorded expense, select it, enter a reason and **Save**. The cancelled entry remains in history and is excluded from recorded-expense totals.

Some installations show a message that expense cancellation is unavailable. In that case, contact the administrator to enable the verified cancellation feature. Do not create an extra positive expense to try to undo an existing one. There is no expense delete or general edit action on this page.

9. Manage Accounts — managers

Use this page to create ordinary workers and manage their names, phone numbers and active status. Search by the profile details shown in the table. Login emails are not displayed in this team table.

Create a worker

1. Select **Create worker**.
2. Enter the worker's name, login email and a unique temporary password of at least 12 characters.
3. Enter a phone number if needed.
4. Select **Create worker** once and wait for the result.
5. Share the login details securely with the intended worker.

The account is automatically an active ordinary worker in your store. You cannot select a different store or give it the manager role. With the updated setup, no confirmation email is sent and the worker can sign in immediately.

If creation fails or the connection drops, do not repeatedly create the same worker. Ask the administrator to check whether the account already exists. The form restricts repeated attempts to avoid duplicate/uncertain account creation.

Edit a worker

1. Find the worker and select **Edit worker**.

2 Update the name, phone or status.

3 Select **Save**.

Set status to **Inactive** to remove access to protected store features. Set it back to **Active** to restore eligible access. An already-open login session does not override an inactive profile.

Manager rows are administrative accounts and cannot be edited through this worker form. Use business signup for a new business; contact the administrator for additional managers in an existing store, store reassignment, email/password changes or account recovery. Staff and transaction history are not deleted here.

10. Batches & Expiry — managers

A batch is a separately identified group of units of the same product. Batch tracking helps control expiry, recalls and traceability. Use the search box to find a product, batch number or other displayed detail.

Turn tracking on for a product with no stock

1 Select **Enable tracking / migrate stock**.

2 Choose an active product that is not already tracked.

3 Tick **Require expiry on every batch** if that product must always have an expiry date.

4 Confirm that existing main stock is zero.

5 Select **Enable on empty stock**.

Future purchases for this product must include batch allocations. Tracking cannot be switched off or reconfigured through this screen after activation, so check the choice first.

Convert existing stock into batches

1 Select **Enable tracking / migrate stock** and choose the product with existing stock.

2 Choose the expiry requirement before continuing.

3 Select **Migrate existing stock** when it appears.

4 Add the actual batch numbers, quantities, dates and initial statuses.

5 Enter a reason for the conversion.

6 Check that the batch quantities add up exactly to the existing main stock.

7 Select **Migrate existing stock** to save.

This organizes stock already present. It does not create a purchase, add extra goods or change the total quantity. Never zero live stock simply to enable tracking. Previous sales without batch records do not gain invented batch history; some later corrections may therefore require administrator help.

Batch statuses

Status	Meaning
Available	Can contribute to sellable stock if it is not expired
Quarantined	Main-stock batch is on hold and cannot be sold
Recalled	Batch is blocked because of a recall

To change a status, select **Set status**, choose the status, enter a reason and **Save**. A recalled batch cannot be released back to available through this workflow. Expired batches cannot be released for sale.

Putting a batch on hold does not physically remove its quantity from main inventory. It changes whether it can be sold. A main-stock batch hold is different from customer-return quarantine.

Adjust a batch

Select **Adjust batch**, enter the positive or negative quantity change and reason, then **Save**. Apply the difference to the correct batch. The app updates its quantity and the product's main balance together, and will not allow a negative batch balance.

How the app chooses stock for sales

The app selects eligible batches with the earliest expiry first. This is often called first-expiring, first-out. Staff do not choose a sale batch manually. Expired, recalled and quarantined batches are excluded. Expiry uses the store's business date; goods are not considered past their expiry merely because the browser uses another timezone.

11. Returns & Refunds — managers

Use this page for goods returned from a real completed sale. Stock handling and recording a refund are separate steps.

Find the right records

Use search or the **Show** list:

- **Active returns:** current valid return records, including those already refunded.
- **Pending refunds (active only):** active returns with a positive refund still to be recorded as paid.
- **Voided entries:** erroneous returns that were voided, retained for audit.
- **All audit history:** active and voided returns together.

Select **Details** to inspect original sale references, products, quantities, refund amounts, holding balances, original batch numbers and quarantine actions. Voided details show who voided the entry, when, and why. A recorded refund shows its method, reference and time.

Record a customer return

1. Select **Record return**.
2. Choose the **Original completed sale** and wait for its details to load.
3. Choose the **Original sale item**, then enter the quantity being returned.
4. For a tracked sale, select the actual **Original sold batch**.
5. Choose the disposition — what should happen to the returned goods.
6. Tick **Inspected and approved for restocking** only when goods are genuinely approved for resale and restocking is selected.
7. Use **Add return item** for more items, or **Remove item** to remove a line.
8. Enter a clear reason, then select **Record return**.

The app limits returns to the quantity originally sold, less previous active returns. For batched sales it also checks the quantity from the selected original batch. It uses the original sale prices, even if today's catalog price

is different.

A return of a zero-priced item can have a refund amount of zero. Across a full return, the app preserves the original sale total. A zero-amount return is marked **not_required** for refund payment and does not need a payment record.

Choose the disposition

Choice	What happens
Quarantine	Holds goods separately; they do not become sellable
Restock after inspection	Adds eligible inspected goods back to main stock
Discard	Records direct disposal for ordinary retail; does not add sellable stock

For pharmacies, returns must enter quarantine and cannot be released for resale. If disposal is appropriate, record quarantine first and then dispose through **Process holding**. The pharmacy restriction remains attached to the return even if the store type changes later.

Ordinary retail restocking can also be blocked for expired/recalled batches or an unknown original batch. Keep such goods in holding or use the appropriate disposal process; do not invent a batch to force restocking.

Process returned goods in holding

1. Find the active return and select **Process holding**.
2. Choose the held return item.
3. Choose **Dispose**, or **Release to main stock** where offered and permitted.
4. Enter the quantity to process; it cannot exceed the amount still held.
5. For release, confirm inspection and approval for resale.
6. Enter the reason and select **Save**.

You may process part of a held quantity and handle the rest later. Disposal reduces return quarantine without adding main stock. Release moves eligible units into main stock. Pharmacy returns do not offer release.

Record a refund payment

1. Find an active pending return and select **Record refund**.
2. Check the full refund amount shown.
3. Perform the actual refund outside this app using your approved payment process.
4. Select the method used: Cash, Card, Bank transfer, Mobile Money, or Other.
5. Enter the payment reference. A reference is required for every non-cash method, including Mobile Money.
6. Tick the confirmation that payment has already been performed.
7. Select **Record paid refund**.

This records payment of the displayed return amount; the form does not provide installment/partial-payment entry. It does not send money, charge a wallet or reverse a bank/card transaction. A return cannot be recorded as refunded twice.

Void a mistaken return entry

Use **Void mistake** only when the return entry itself was erroneous and no actual goods should remain in return quarantine.

1. Check the return's **Details** and verify the mistake.
2. Select **Void mistake** if offered.
3. Enter the reason and tick the confirmation.
4. Select **Void mistaken entry**.

Only untouched, unrefunded quarantine returns are eligible. Restocked, discarded, refunded or already processed returns cannot be voided. Some earlier decimal returns cannot be voided while doing so would make later refund rounding incorrect; follow the message or ask the administrator for help.

Voiding keeps the original record and amounts for audit, marks it voided and clears the erroneous holding balance. It does not dispose of real goods or reverse a payment. If needed, enter a new correct return afterward. Voided entries cannot be processed/refunded and are excluded from the active refund queue, even if an old refund label still says pending.

12. Reports — managers

Use Reports for database-calculated store totals and CSV exports.

View a report

1. Choose a report from the **Report** list.
2. Select the **Start date** and **End date**.
3. Select **Apply filters**.
4. Check that the chosen report and period are correct before using the figures.

Report	What it shows
Net sales	Gross sales less active return amounts
Gross sales	Completed sales before returns are deducted
Return entitlements	Amounts approved by active return records, grouped by return date
Recorded refund payments	Refunds recorded as paid, grouped by refund-payment date
Expenses	Recorded expenses grouped by day and category
Low stock	Current products at or below their sellable reorder levels

Low stock is a current snapshot: changing dates does not turn it into a historical inventory report. Days without activity may have no row. Business dates use the store timezone, not necessarily the phone's timezone.

Returns and refund payments are different measures. Net sales already deducts active return amounts, so do not subtract recorded refunds from it again. A later day can show negative net sales when returns relate to sales made on earlier days. Voiding an error can change the affected historical report totals.

Export a report

After applying filters, select **Export CSV**. Open the downloaded file in Excel or another spreadsheet app. It contains the selected report rows; it is not a full database backup. If there are no rows, the app reports that there is nothing to export.

13. Operating Summary — managers

This page replaces the earlier demo Profit & Loss screen.

1. Select the start/end dates.
2. Select **Apply period**.
3. Review **Net sales**, **Recorded expenses**, and **Sales less expenses**.

Example: gross sales of 1,000 less active returns of 100 gives net sales of 900. With recorded expenses of 200, sales less expenses is 700.

The 700 is not net profit. The summary does not deduct historical cost of goods sold, tax and all other accounting costs. Do not treat current buying prices as a complete historical profit calculation. Use the figures with that limitation in mind and ask your accountant/administrator for additional accounting reports where needed.

14. Audit History — managers

Audit History is a read-only record of stock and related actions. It helps explain what changed and check whether an uncertain save actually succeeded.

1. Choose a **Record type**.
2. Use the search box to find a product, reason or full action/request ID.
3. Review product names, batch numbers, quantities, reasons and the person/time recorded. Select **Details** for more information; expand **Support references** only when you need technical references.

Record type	Use it to review
Stock movements	Stock additions, deductions and transaction-related changes
Batch allocations	Which batches were involved in a movement
Batch status changes	Holds, recalls and other status decisions
Existing-stock migrations	Conversions of already-held stock into batch tracking
Migration batch allocations	The quantities assigned to each batch during conversion
Return quarantine actions	Releases and disposals from returned-goods holding

You cannot edit, delete or directly export audit rows from this page. Use the Reports page for its available CSV exports. Contact the administrator if a history discrepancy needs investigation rather than trying to remove evidence of an error.

15. Settings — managers

Settings displays the organization, store, store type, timezone, currency setting and your account details. Expand **Support references** to find the store and account reference numbers when support needs them.

Set the store timezone

1. Select **Set timezone**.
2. Choose the correct timezone.
3. Select **Save**.

For Zambia use **Africa/Lusaka**, which is CAT, UTC+2. The timezone affects report business dates and expiry decisions, so change it only when appropriate. A change may regroup historical reports into different business dates.

Other displayed details are not editable through this screen. Ask the administrator to change organization/store details, store type, currency, manager accounts or store assignments. If no currency is configured, the app shows numeric amounts without assuming a currency symbol.

16. Useful daily workflows

A manager setting up products and stock

1. Add the supplier and contact numbers.
2. Give different sizes or packs separate, clear product names.
3. Add each product with its prices. Enter a SKU if you use your own product codes, or leave it blank.
4. Enable batch/expiry tracking before receiving stock if required; migrate existing stock instead if it is already present.
5. Receive supplier purchases and their batch details.
6. Set useful reorder levels and check sellable quantities.
7. Create worker accounts and share credentials securely.

A worker serving customers

1. Sign in and confirm the store.
2. Check the product, unit and selling price.
3. Complete the store's payment process.
4. Record the sale once and confirm it appears in your history.
5. Ask the manager to handle returns, stock corrections or a sale cancellation.
6. Log out when leaving a shared device.

A manager reviewing the day

1. Review the Dashboard and full Sales history.
2. Check active pending refunds and goods still in return holding.
3. Review low stock, expiry concerns and held/recalled batches.
4. Record genuine store expenses.

5 Review dated sales/return/refund/expense reports and export CSVs where useful.

6 Investigate discrepancies through Audit History and keep test records separate from genuine business activity when interpreting reports.

17. If something goes wrong

What you see	What to do
Invalid login or inactive account	Recheck the credentials; ask the manager/administrator to confirm the account and store status
Insufficient stock	Reopen Inventory and check sellable stock, not just physical stock; check held or expired batches
Quantity precision error	Use whole numbers such as 1, 2 or 3
Duplicate SKU	Search first; use the existing record or a different unique SKU
Missing batch/expiry details	Choose the real batch and complete the required dates and quantities
Return exceeds sold quantity	Check the original sale and previous active returns; do not choose a different sale just to bypass the limit
Non-cash refund requires a reference	Enter the reference for the actual refund already performed
Mobile Money rejected as an invalid method	Ask the administrator to apply the Mobile Money database update; do not silently record it as Cash
Cancellation/void is blocked	Read the reason; the goods/payment may already have been processed and need a different approved correction
No permission, blank table or missing button	Check your role/store, filters and account status; contact the manager if access is unexpected
Could not load the app or a function is unavailable	Give the administrator the page, time and error text so they can check the deployed version

A save times out or its result is unclear

1 Do not repeatedly submit a fresh transaction.

2 Expand **Support references** on the form and copy the **Request ID** before closing it, if present.

3 Check the relevant sales, purchases, return or audit history for that ID and compare the items/quantities.

4 Select the affected page again in the menu. Ask the manager/administrator to investigate if you cannot confirm the result.

5 Only start a new action once the outcome is understood.

Some forms keep the original entries locked after an uncertain response to prevent a changed retry from becoming a different transaction. A duplicate or state error on retry does not automatically mean the original action failed. Worker creation also needs an account check before another attempt.

Do not send passwords or payment credentials in screenshots or support messages. Useful support details are the store name, page, time, exact error text, and sale/purchase/return/request reference.

18. Quick reference

Word or label	Plain meaning
Active	Currently enabled; for returns, a valid entry rather than a voided error
Completed sale	A saved sale that has not been cancelled
Received purchase	A saved supplier receipt whose goods were added to stock
Cancelled	A reversed transaction retained in history
Pending refund	A positive return amount not yet recorded as paid
Refunded	The app has a record that the external refund was performed
not_required	No refund payment record is needed because the return amount is zero
Voided	A mistaken eligible return entry marked invalid but retained for audit
SKU	Your store's product code
Batch	A separately identified group of units of a product
Quarantine	Goods held out of sale pending a decision; batch holds and return holding are separate
Reorder level	Sellable quantity at/below which a low-stock alert is raised
Request ID / transaction ID	A long unique reference used to locate and reconcile an action

The app records business activity. Real payments, safe handling/disposal of goods, account administration and any additional industry requirements still follow your store's approved processes.

Mobile version, dark mode and offline sales

Choose **Mobile version** at the bottom of a page to open the mobile interface. Use **Menu** to switch pages. Choose **Web version** to return to the normal web interface. The sun or moon button changes between light and dark colors and remembers your choice on this device.

To prepare for offline use, sign in while connected and visit the pages you will need. Allow the first load to finish. Previously visited pages can then show saved information when your connection drops. This saved information can be out of date. First login requires internet; saved access lasts up to 24 hours after the last online account check.

You can record a sale offline. The app saves it on this device and marks it **pending sync**. It has not yet become a confirmed sale and does not reserve stock. Open **Offline & sync** to see the items, save time, payment method and status of each saved sale.

When you reconnect with the app open, pending sales upload automatically. You can also press **Sync now**. The server checks your access, stock and current prices. A successful upload becomes **synced**. If stock or access has changed, the request stays available for review with an explanation.

If an upload was interrupted, press **Check server** to check whether the sale already exists. The app compares the original reference, account, store, payment method and quantities. Use **Review / retry** only after checking the transaction; it keeps the same reference. Do not enter the same sale again as a new transaction.

Keep your browser data until every pending sale is resolved. Clearing site data can permanently remove unsynced sales. Purchases, returns, refunds, stock changes, product edits and account management require internet. This mobile version runs in a browser; it is not an Android installation file.

Original mobile layout and sale window

The mobile interface uses the original dashboard cards, card-style product and inventory lists, and large action buttons. **Suppliers & Purchases** opens one section with separate Suppliers and Purchases tabs. Organization, returns, batches, audit and offline-sync pages remain available according to your access.

On the mobile dashboard, **Record sale** opens the sale window without leaving the dashboard. On the Sales page, choose **New Sale**:

1. Search for a product by name or SKU.
2. Press **Add to Sale** on each product you want.
3. Use **+**, **−**, or the quantity field to change whole-item quantities. Use **Remove** to remove an item.
4. Choose the payment method. The subtotal and total shown are estimates until the sale is accepted.
5. If useful, enter **Amount received** to calculate estimated cash change. This calculator does not record a separate payment or transfer money.
6. Press **Complete sale** once. If offline, the sale is saved as pending sync. If a save is uncertain, keep the window open and retry the same request; the cart is locked to prevent accidental changes.

On mobile Inventory, managers can use **Record Stock Movement** to choose a product, enter a positive quantity for stock in or a negative quantity for stock out, and give a reason. Tracked products use **Batches & Expiry**. Stock changes require internet.

The restored layout uses current backend figures and supported fields. It does not use the old demonstration records or estimated profit calculations.
